Branch: BE-CSE Section/Group: KRG-2B

Semester: 5th

Subject Name: PBLJ

Date of Performance: 23/9/25

Subject Code: 23CSH-304

Aim: To develop a ticket booking system with synchronized threads to ensure no double booking of seats. Use thread priorities to simulate VIP bookings being processed first.

Objective: To understand multithreading, thread synchronization, and thread priorities in Java.

Input Used: Thread, synchronized method, setPriority(), ticket counter simulation.

Procedure:

- 1. Create a TicketBooking class with synchronized bookTicket() method.
- 2. Use a Thread class to simulate customers (normal and VIP).
- 3. Create threads with different priorities.
- 4. Start threads and observe how VIPs are handled first due to higher priority.
- 5. Ensure no 2 threads can book the same seat using synchronization.

Sample Input -

Thread 1: Normal User - Booking Seat 1 Thread 2: VIP User - Booking Seat 1

Sample Output -

VIP Thread booked Seat 1

Normal Thread could not book. Seat already booked.

Code –

```
package Experiment_Codes;

class TicketBooking {
    private boolean isBooked = false;

    public synchronized void bookTicket(String userType, String threadName) {
        if (!isBooked) {
            System.out.println(userType + " " + threadName + " booked the
        seat.");
        isBooked = true;
        } else {
```

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

```
System.out.println(userType + " " + threadName + " could not book.
Seat already booked.");
class Customer extends Thread {
   private TicketBooking bookingSystem;
   private String userType;
    public Customer(TicketBooking bookingSystem, String userType) {
        this.bookingSystem = bookingSystem;
        this.userType = userType;
    public void run() {
        bookingSystem.bookTicket(userType, Thread.currentThread().getName());
public class Exp4 {
    public static void main(String[] args) {
        TicketBooking booking = new TicketBooking();
        Customer normalUser = new Customer(booking, "Normal User");
        normalUser.setName("Thread 1");
        Customer vipUser = new Customer(booking, "VIP User");
        vipUser.setName("Thread 2");
        normalUser.setPriority(Thread.MIN PRIORITY);
        vipUser.setPriority(Thread.MAX_PRIORITY);
        normalUser.start();
        vipUser.start();
```

```
Output—
PS C:\Users\gupta\OneDrive\Desktop\Sem 5\PBLJ> & `C:\Pro
' '-cp' 'C:\Users\gupta\AppData\Roaming\Code\User\workspa
es.Exp4'
Normal User Thread 1 booked the seat.
VIP User Thread 2 could not book. Seat already booked.

PS C:\Users\gupta\OneDrive\Desktop\Sem 5\PBLJ>
```
